

Cube CORS is the networking suite part of Stonex that deals with the remote management of receivers. Cube-cors has a simple web interface for the remote management of Stonex GNSS receivers. It allows to check the operational status, the management of the configuration and the receivers update.

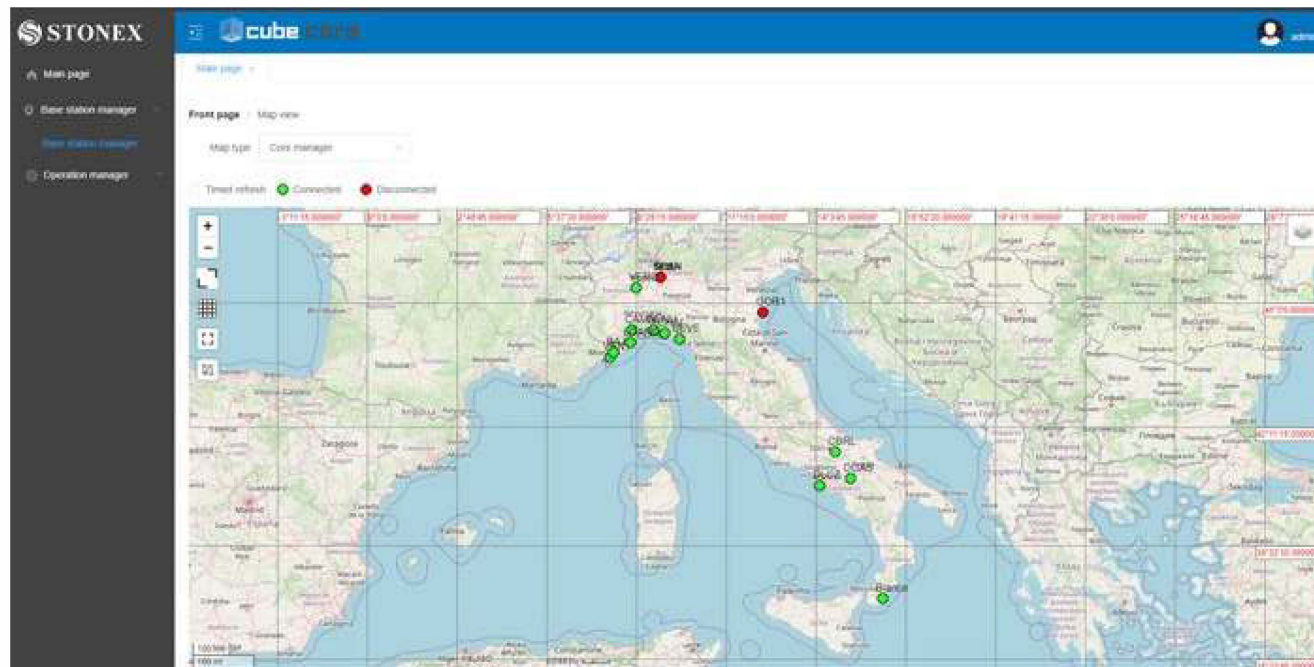

The program web interface has two main windows: a Map window and Device Management window. The status of the receivers is immediately visible. All functions are easily accessible, and the customer has quick access to all information right from the beginning, without the need for extensive training
